Muneef Mumthas

muneef.mumthas@outlook.com · · ·

SUMMARY

Full-stack AI engineer with a First Class BSc in Artificial Intelligence. I build AI products end to end and integrate AI into existing systems: I train and evaluate models, ground their answers in retrieval, orchestrate agents and tools, write and test prompts, then build the back end and interface around them. I trained and open-sourced Unee, small language models that score up to 88% on DecideBench and run on a laptop or in a browser tab, and built a company's operations platform and n8n automations. My focus is dependable AI: calibrated confidence, leak-free evaluation and grounded answers. Available immediately for a full-time role and open to relocation.

EDUCATION

BSc (Hons) Artificial Intelligence, *Buckinghamshire New University, United Kingdom* Feb 2022 – Feb 2026
First Class Honours. Relevant modules include Machine Learning, Deep Learning, Programming, and Cybersecurity & Cloud Fundamentals.

Cambridge GCE AS Level, *Sri Lankan International School Jeddah, Saudi Arabia* Sep 2020 – Jun 2021
Accounting (A), Information Technology (A), Mathematics (A), Physics (A).

Cambridge IGCSE, *Sri Lankan International School Jeddah, Saudi Arabia* Sep 2019 – Jun 2020
A*: Accounting, ICT, Mathematics, Physics; B: Biology, Business Studies, Chemistry, English.

EXPERIENCE

AI & Workflow Automation Engineer (Contract), *Cambridge Marketing, Sri Lanka* Aug 2026 – Present

- Designed and built the **Cambridge Hub ecosystem** from scratch, replacing disconnected tools with one platform behind a single sign-in: finance, HR, self-service, admin, tasks, CRM and client portals as separate apps.
- Built **CambWA**, a WhatsApp CRM with an AI assistant that answers enquiries from each client's own knowledge, qualifies the lead, follows up automatically and hands over to a person when it is unsure.
- Built a self-hosted **n8n lead engine** that runs 208 search tasks across 26 market zones unattended: it collects public business listings, enriches each one from the business's own website, scores and deduplicates the results, and saves a checkpoint after every task so a stopped run keeps its work.
- Automated day-to-day workflows: a CRM lead becomes a proposal and a client plan, a confirmed salary becomes a payslip and a bank salary file, and weekly, monthly and board reports are generated on demand.
- Built the migrations that move the legacy finance system and the live CRM onto the platform.
- Designed every app's interface on one shared design system and built the access controls behind it: role-based access per app, authenticator sign-in, a hash-chained audit log, signed releases and encrypted off-site backups.

Product Engineer, Independent Projects (Part-time), *UNEEVERSE* Jan 2026 – Present

- Build and release my own products part-time under the UNEEVERSE name, alongside my main work: I find a point of friction, build the tool that removes it and publish it, usually as open source.
- Trained and open-sourced **Unee**, small language models that score up to 88.0% on DecideBench and run on a laptop or in a browser tab, and released **UNEEFLOW**, a free no-code machine learning desktop app.
- Carry each product from idea to release myself: brand and interface design, front end, back end, model training and evaluation, packaging, and the website and documentation that launch it.

Programmer / Research Assistant, *Buckinghamshire New University, United Kingdom* Feb 2026 – Jun 2026

- Led development of a privacy-first AI system, built in collaboration with Mosaic Building Design, that analyses architectural survey plans against UK regulations using locally hosted LLMs, so client drawings never leave the firm's own machines.
- Built its document-understanding pipeline in Python, combining PDF processing, OCR, computer vision and local LLM inference, and evaluated vision language models and quantised GGUF models for reading the plans.
- Independently architected and deployed pipelines combining machine learning, model optimisation and rule-based validation for intelligent decision support.

PROJECTS

Unee *(Python, llama.cpp, ONNX, WebGPU, MCP)* Open source

- Two small language models (0.8B and 2B) that decide, chat and answer from the user's own knowledge. Every decision returns a calibrated probability, so an app knows when to act and when to ask a person.
- Score 84.0% and 88.0% on DecideBench, measured with the benchmark's own harness: the 0.8B model beats every listed model under 1B, and the 2B model is right 97.2% of the time when it says it is sure.
- Trained by distilling a 9B teacher model that writes and labels synthetic tasks across 40 task families, with a leakage checker that compares every evaluation set with the training text.
- Run without a GPU, an API key or a per-call fee: 4-bit GGUF and ONNX builds for llama.cpp, WebGPU and WASM, a 469 MB in-browser download, pip, npm and Ollama packages, and MCP tools for AI agents.
- Cut replies containing an unsupported fact from 10.3% to 6.0% on a 116-question grounded-answer test, with a strict mode in which the model checks its answer sentence by sentence against the retrieved documents.

CareerOS *(Python, FastAPI, React, TypeScript, Playwright)* Personal tool

- Local-first agent pipeline for job and scholarship applications: an orchestrator runs single-purpose agents for search, discovery, company research and verification, and stores every claim with its source and evidence.
- Writes applications only from a fact database built from the user's CV, behind a 21-point quality gate, and its browser agent stops at CAPTCHA, sign-in, payment and final submit so a person approves each one.

Cambridge Hub Ecosystem *(React, TypeScript, PHP, SQLite)* In production

- **Finance and HR:** ledger with invoices, receipts, bank reconciliation, budgets and a multi-page board pack; employee records, attendance, leave, payslips, statutory summaries and a bank salary file.
- **Admin, CRM and Tasks:** roles and per-app access, signed releases that can be rolled back from the browser, a sales pipeline with teams and targets, and task boards with a submit and approve flow.

UNEEFLOW *(Python, CustomTkinter, scikit-learn, local LLM)* Released for Windows

- Guided workflow for tabular data: import CSV, Excel or JSON files, read an automated profiling report, choose the target and inputs, handle missing values and encoding, then train classification or regression models.
- Explains model metrics with an optional LLM-written interpretation, exports trained models and generates a prediction interface to test them at once. Offline-first, so data stays on the user's device.

AWS Secure Web System *(EC2, IAM, VPC, Security Groups, DynamoDB)*

- Designed and deployed a secure, cost-efficient cloud system for a rental agency: a dynamic website whose contact form stores submissions in DynamoDB, with least-privilege IAM roles and a segmented VPC.

Hybrid Loan Approval System *(Neural networks, fuzzy logic, explainable AI)*

- Built a fuzzy-logic model aligned with neural network feature importances, giving loan decisions that are transparent to explain without giving up predictive performance.

SKILLS

AI and LLMs	LLM fine-tuning and distillation, evaluation and benchmarking, RAG, quantisation (GGUF, ONNX), llama.cpp, OpenAI and Claude APIs, prompt engineering, local LLM inference
Agents	Agent orchestration, tool use and MCP, n8n workflow automation, browser agents, human approval gates, AI-assisted development with Claude Code and Codex
Machine learning	scikit-learn, neural networks, AutoML, explainable AI, fuzzy logic, feature engineering, NumPy, Pandas, Matplotlib, TensorFlow (basics)
Languages	Python (primary), TypeScript, JavaScript, PHP, SQL, C#, C++, Java, HTML, CSS
Full stack	React, Vite, Tailwind CSS, FastAPI, Flask, REST APIs, SQLite, MongoDB, DynamoDB
Engineering	Docker, Git, AWS (EC2, IAM, VPC), Playwright and Vitest testing, role-based access, two-factor sign-in, OWASP ASVS, UI/UX design

CERTIFICATIONS

British Airways Data Science Job Simulation, Forage · Cognizant AI Job Simulation, Forage
